**Question 1**  
Correct  
Answered out of 100  
Flag question

A set of  $N$  numbers (separated by one space) is passed as input to the program. The program must identify the count of numbers where the number is an odd number.

Input Format:

The first line will contain the  $N$  numbers separated by one space.

Boundary Conditions:

$2 \leq N \leq 100$

The value of the numbers can be from  $-9999999$  to  $9999999$ .

Output Format:

The count of numbers where the numbers are odd numbers.

Example Input / Output 1:

Input:

5 10 15 20 25 30 35 40 45 50

Output:

5

Explanation:

The numbers meeting the criteria are 5, 15, 25, 35, 45.

**Answer:** Identify regions (0 to)

```
#include <stdio.h>
int main()
{
    int N, count=0;
    char str[100];
    while (1)
    {
        scanf("%d", &N);
        if (N==0)
            break;
        scanf("%s", str);
        for (int i=0; i<N; i++)
        {
            if (str[i]%2!=0)
                count++;
        }
        printf("%d\n", count);
    }
    return 0;
}
```

Input	Expected Out
5 10 15 20 25 30 35 40 45 50	5

**Question 2**  
Correct  
Answered out of 100  
Flag question

Given a number  $N$ , return true if and only if it is a confusing number, which satisfies the following conditions:

We can rotate digits by 180 degrees to form new digits. When 0, 1, 6, 8, 9 are rotated 180 degrees, they become 0, 1, 9, 6 respectively. When 2, 3, 4, 5 and 7 are rotated 180 degrees, they become invalid. A confusing number is a number that when rotated 180 degrees becomes a different number with each digit valid.

Example 1:

$N = 6$

Output: true

Explanation:

We get 9 after rotating 6. 9 is a valid number and 9 != 6.

Example 2:

$N = 89$

Output: true

Explanation:

We get 68 after rotating 89. 89 is a valid number and 89 != 68.

Example 3:

$N = 11$

Output: false

Explanation:

We get 11 after rotating 11. 11 is a valid number but the value remains the same, thus 11 is not a confusing number.

Note:

- 0 is not a confusing number.
- After the rotation we ignore leading zeros, for example, after rotation we have 0009 then this number is considered as just 9.

**Answer:** Identify regions (0 to)

```
#include <stdio.h>
int main()
{
    int N, isConfusing;
    char str[100];
    while (1)
    {
        scanf("%d", &N);
        if (N==0)
            break;
        scanf("%s", str);
        for (int i=0; i<N; i++)
        {
            if (str[i]!='0' && str[i]!='1' && str[i]!='6' && str[i]!='8' && str[i]!='9')
            {
                isConfusing = 0;
                break;
            }
        }
        if (isConfusing)
        {
            int rotatedN = 0;
            for (int i=0; i<N; i++)
            {
                if (str[i]=='0')
                    rotatedN = rotatedN*10;
                else if (str[i]=='1')
                    rotatedN = rotatedN*10 + 1;
                else if (str[i]=='6')
                    rotatedN = rotatedN*10 + 9;
                else if (str[i]=='8')
                    rotatedN = rotatedN*10 + 8;
                else if (str[i]=='9')
                    rotatedN = rotatedN*10 + 6;
            }
            if (rotatedN != N)
                isConfusing = 1;
        }
        printf("%d\n", isConfusing);
    }
    return 0;
}
```

Input	Expected Out
6	true
89	true
11	false

**Question 3**  
Correct  
Answered out of 100  
Flag question

A restaurant is planning to launch a new menu item. Every food item is assigned a unique ID, which is a sequence of digits from 1 to 9, and all items have a value associated with them. An item's value is the sum of the digits of its ID. For example, food item with value 1 has 1 macro-nutrient, food item with value 2 has 2 macro-nutrients, and increasing in this fashion, and this is the case for all items. The restaurant has a list of items in the increasing order of their value. Complete the regular test of macro-nutrients that can be provided to a customer, without the sum matching the given value.

Here is an illustration:

Given 4 food items (their value, 1, 2, 3 and 4), and the restaurant sum being 6 macro-nutrients, an ordering items 1, 2, 3 - the sum is 6, which matches the 'unhealthy' sum. Hence, one of the three needs to be dropped. The best combination is item 1.

$1 + 2 + 3 = 6$

$1 + 2 + 4 = 7$

$1 + 3 + 4 = 8$

$2 + 3 + 4 = 9$

Since  $2 + 3 + 4 = 9$  allows for maximum number of macro-nutrients, 9 is the right answer.

Complete the code in the editor below. It must return an integer that represents the maximum total of macro-nutrients, modulo  $1000000007$  ( $10^9 + 7$ ).

It has the following:

- an integer that denotes the number of food items.
- an integer that denotes the 'unhealthy' number.

**Constraints:**

- $1 \leq n \leq 10^5$
- $1 \leq u \leq 10^9$

Input Format For Custom Testing

The first line contains an integer,  $n$ , that denotes the number of food items.

The second line contains an integer,  $u$ , that denotes the 'unhealthy' number.

**Sample Input 0**

2

2

**Sample Output 0**

3

**Explanation 0**

The following sequence of  $n = 2$  food items:

- Item 1 has 1 macro-nutrient.
- $1 + 2 = 3$  indicates that this is the max total, and being avoided being exactly  $n = 2$  macro-nutrients.

**Sample Input 1**

2

1

**Sample Output 1**

2

**Explanation 1**

- Cannot use item 1 because  $1 + 1$  food sum is 2 has to be avoided at any time.
- Hence, max total is achieved by sum  $= 1 + 2 = 3$ .

Sample Case 2

**Sample Input For Custom Testing**

**Sample Input 2**

3

5

**Sample Output 2**

5

**Explanation 2**

$2 + 3 = 5$  is the best case for maximum nutrients.
